Welcome to the Esonet Yellow Pages, A Tool for Interoperability and Standardization

The Concept

MYSQL, HTML, Javascript e CSS

The ESONET Yellow Pages aim to organize the information concerning on the shelf products for the development and maintenance of Deep-Sea Observatories, provided by the private sector. This includes a range of equipments, from simple, isolated sensors or parts, to communication systems or even integrated Observatories.

ESONET Yellow Pages are built upon a database with descriptions of available products, as well as information from manufacturing companies that design and assemble them. In this database, not only the technical specifications (from stand-alone to complex inter-operative systems) but also, compatibility and standardization requirements should be easily accessed in the descriptive synopsis of each item.

Information on physical characteristics (size, temperature, depth, etc) as well as communication characteristics, deployment and recovery method or platforms to be utilized by any particular model is provided. Links to Companies, Research groups, Projects, funding Programmes and Organizations will also be available. Whole Platform descriptions, whenever available to the market, their versatility and instrument integration.

ESONET Yellow Pages will also aim to establish a feedback from all the community around the Sea exploitation with pertinent and updated information on their contributions, addressing reliability for long-term operations and experience on the use in real deep sea conditions. This should enable any current and prospective Equipment Designer to assemble an operational system with improved probability to work properly and according to anticipated performance. In this sense, ESONET Yellow Pages will also be an important tool to disseminate information of the ESONET label for deep sea observatories.
